

Q&A and Hands-On

Your turn at the keyboard

The Tension

- The same agent is a patient TA and a tireless cheat
- It can explain a concept or write the whole assignment
- The fix is structural, not technological

good: explain pointers to me

bad: write my malloc `for` me

same `tool`, your call

AI and Non-AI Tracks

- Offer a final project in two tracks
- Non-AI track is graded for the learning, not the output
- Let students choose, and make the choice honest

Track A: no AI

smaller scope, graded on craft

Track B: AI allowed

bigger scope, graded on result

You Have to Write the Code

- You cannot read code well until you have written it
- Outsourcing the writing skips the learning
- The classroom is the safe place to build that skill

write -> struggle -> understand

-> read others' code

-> build real systems

skip the first step and the

rest falls apart

Hands-On

- Open Claude Code against the course repo
- Generate a short deck, then a quiz from a notes file
- Add a CLAUDE.md rule and watch the output change

```
> draft a 5-slide deck on  
binary addition
```

```
> generate a 3-question quiz  
from these notes
```

```
> add a rule: code blocks  
max 8 lines
```

Summary

- The agent is both a good tutor and an easy cheat
- The answer is structural: how you assess, not what you ban
- AI and non-AI tracks let students opt into real work
- Writing code is the prerequisite for reading code
- The classroom is the safe place to build that skill
- Try the tools yourself before you decide your policy
